

Certificate of Completion

THIS CERTIFIES THAT
CALEB FELLOWES

has participated in the following education session:

Delirium Clinical Care Standard 2016

Presenter The Nursing CPD Institute

In this session, you will:

- Gain knowledge regarding the incidence of delirium occurring in Patients over the age of 65 years in Hospitals in Australia
- Learn about standard processes that should be implemented in your workplace when caring for those who are at risk of delirium
- Become aware of the specific indicators that can be used to monitor the success of managing delirium in hospitals

Completed on

26 April 2019 (duration of 1 hour/s)

This equates to 1 CPD Hour/s (Continuing Professional Development)

REFLECTION:

Delirium is an acute change in mental status that is common among older people in hospital. Characterised by a disturbance of consciousness, attention, cognition and perception that develops over a short period of time (usually hours to a few days), delirium is a serious condition and is associated with increased risk of harm.

Compared with people of the same age who do not have delirium, people with delirium have an increased risk of death, increased risk of falls, a greater chance of being discharged to a higher dependency of care, and a greater chance of developing dementia.
